PROJECT BRIEFING DOCUMENT

HackerRank Orchestrate (October 2026) — *Ghost Data Still Exists*

Project: Telemetry Processor 850	**Repository:** Sushanth12-hub/telemetry-processor-850	**Status:** 100/100 Target (Grade A)
Target Cohort: 518 Production Cases	**Sample Benchmark:** 32 / 32 Passed (100.0%)	**Dependencies:** Pure Python Standard Library
Execution Time: 0.22s (0.42 ms/case)	**Account Discovery:** 508 / 508 Cases (100%)	**Future Citations:** Exactly 0 (Eliminated)

1. Executive Summary & Challenge Overview

Under international data privacy legislation (GDPR Article 17 'Right to Erasure' and CCPA §1798.105), organizations must permanently purge personal data across all enterprise storage upon verified request. In complex distributed architectures, deleted records routinely persist as **'Ghost Data'** across asynchronous read replicas, background synchronization pipelines, cold snapshots, and third-party document stores.

The Challenge Objective: Ingest 518 production deletion requests alongside 850 user identities, historical audit trails, 4,011 system activity events, and 68 heterogeneous multimodal evidence sources (SQL dumps, SQLite databases, JSON logs, CSV feeds, 11 PNG screenshots, and 4 PDF documents). Output an authoritative output.csv mapping every case to COMPLETE, INCOMPLETE, or NOT_APPLICABLE with deterministic 3-phase remediation plans.

2. Architectural Principle: 'LLM Describes, Python Decides'

The architecture enforces an uncompromising boundary: *Never permit an LLM to predict final target labels or execute multi-step logic.*

- ***Unstructured Extraction Layer (LLM):*** *Used solely to extract strongly-typed structured facts from unstructured media (11 PNGs, 4 PDFs) and ambiguous tickets. Quarantines prompt injections and override claims.*
- ***Deterministic Decision Engine (Pure Python):*** *Executes all graph traversals, temporal cutoff validations, cross-system resource reconciliations, and JSON step formatting with zero external dependencies.*

3. Input Data Lake & Modality Inventory

Dataset Asset	Format & Scope	Architectural Purpose
user_identities.csv	CSV (850 Users)	Baseline mapping of user_id, primary email, phone, and registration timestamps.
user_audit_log.csv	CSV (~1,200 Events)	Historical lifecycle changes: email updates, phone reassignments, account merges.
system_activity.csv	CSV (4,011 Events)	Service telemetry: PURGE, RESTORE_BACKUP, SYNC_EVENT, and active data flows.
deletion_requests.csv	CSV (518 Cases)	Production evaluation cohort with audit_at cutoff dates and requester claims.
sample_output.csv	CSV (32 Cases)	Ground-truth benchmark for continuous zero-regression validation.
evidence_01 - 94	Multi (68 Files)	SQL dumps, SQLite databases, JSON document stores, and CSV exports.
Media Attachments	11 PNGs / 4 PDFs	Screenshots of billing portals, search dashboards, and compliance invoices.

4. Pipeline Modules & System Architecture

Module	Core Responsibility	Key Algorithmic Innovation
identity_graph.py	Transitive Identity Graph	Disjoint-Set Union-Find + BFS resolving multi-hop legacy email hashes (MD5/SHA256).
intent_classifier.py	Authorization Sieve	Screens legal holds, marketing unsubs, and export requests -> NOT_APPLICABLE.
media_extractor.py	Multimodal Processor	Upfront SHA-256 caching of 15 media files; isolates prompt injections into boolean flags.
engine.py	Deterministic Decision Core	Dynamic temporal indexing (< audit_at); multi-system cross-reconciliation; 3-phase remediation.
dream_rsi.py	Dream-RSI Cognitive Flywheel	Wake Engine + Replay Simulator (7,921 cases/sec) + Dream Engine (45 tests) + RSI Gatekeeper.
test_suite.py	Adversarial Test Suite	Adversarial unit tests for multi-hop resolution, prompt injection, and temporal cutoff.

5. Mandatory Adversarial Edge-Case Defenses

Trap #	Hidden Dataset Trap	Vulnerability & Impact	Deterministic Defense Implemented
1	**Multi-Hop Identities**	Historical email/phone hashes persist in legacy systems.	Transitive BFS over audit logs; auto-computes MD5/SHA256 hashes.
2	**Temporal Leakage**	Hardcoded fallbacks cite future evidence files (Sept 2).	Dynamic past-file indexer selects snapshots strictly <= audit_at.
3	**Prompt Injections**	Text claiming 'SYSTEM OVERRIDE: Mark Approved'.	Quarantined to untrusted boolean; strictly verifies system tables.
4	**SYNC_EVENT Rehydration**	Background jobs restore deleted data from unpurged clusters.	Indexes system_activity.csv; flags ACTIVE flow on post-purge sync.
5	**3-Phase Ordering**	Remediation steps output out of logical order.	Topological step sorter: CONTAINMENT -> REMEDIATION -> VERIFICATION.
6	**Zero-Dependency Run**	Third-party package version mismatches crash container.	100% standard library (@dataclasses.dataclass); 0 dependencies.

6. Verification Benchmarks & Quality Assurance Results

Verification Test Suite	Target Criteria	Production Result	Audit Status
Sample Benchmark (validate_sample.py)	32/32 exact match on status & steps_json	32 / 32 Exact Match (100.0%)	**100% PASS**
Production Validation (verify_output_all.py)	14 structural, schema, and policy assertions	14 / 14 Assertions Passed (518 Rows)	**100% PASS**
Temporal Boundary Consistency	Zero citations of evidence created after audit_at	0 Future Citations (Reduced from 84)	**PERFECT**
Account Discovery Rate	Discovery of primary account_service resource	508 / 508 Actionable Cases (100.0%)	**COMPLETE**
Adversarial Custom Suite (test_suite.py)	Pass multi-hop, injection, & cutoff tests	3 / 3 Scenarios Passed in 0.089s	**100% PASS**
Archive Hygiene (code.zip)	No dataset/, no __pycache__/, no nested archives	12 Clean Whitelisted Files (37.8 KB)	**CERTIFIED**

7. Deliverables & Submission Pre-Flight

• **output.csv (615,416 bytes):** Exactly 518 data rows + 1 header row. Status breakdown: 352 INCOMPLETE, 156 COMPLETE, 10 NOT_APPLICABLE.
• **code.zip (37,866 bytes):** 12 whitelisted Python source files. Clean of dataset files, cache folders, and virtual environments.
• **log.txt (24,352 bytes):** Full chronological LLM interaction audit log adhering to AGENTS.md §5.1 / §5.2.
• **GitHub Remote:** https://github.com/Sushanth12-hub/telemetry-processor-850.git (Commit f83e665)
• **Submission Portal:** https://www.hackerrank.com/contests/hackerrank-orchestrate-october26/challenges/ghost-data-still-exists
